

Matriculation Number: 227129(Manas Samant)

I learned how to build a simple serverless application using AWS Lambda and Amazon API Gateway. The course that you recommend to do before working on the AWS were instrumental in making my task easier while performing it as I was exposed to basics of AWS Lambda Function in those courses.

In AWS Lambda Foundations, I got to know what is the functioning of AWS Lambda. This course also taught me how to configure my Lambda Function as well how to deploy and Test Serverless Applications.

Amazon API Gateway for Serverless applications enriched me with how not only I can design web socket APIs but also REST APIS. This course also covered managing API access and Data Mapping.

To practically execute this, I built a simple serverless greeting service using AWS Lambda and API Gateway. I created and deployed a Lambda function, configured permissions with an execution role, and connected it to an HTTP API with a /hello route. After deploying the API, I tested the endpoint through the browser and verified responses. Finally, I reviewed CloudWatch logs to confirm successful invocations and understand how AWS services interact securely.
